

Frameline Generator

for all monitors

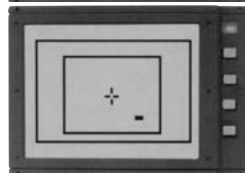

The first user-friendly Frameline Generator

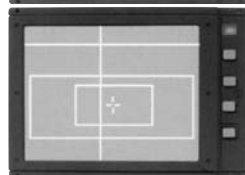

Transvideo Frameline Generator displays 1, 2 or 3 framelines, a cross and a marker.

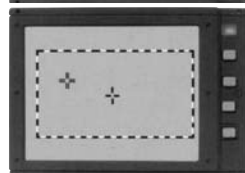

The framelines brightness can be adjusted from black to white and from full lines to dots.

The marker can be a double-cross, a square, or two perpendicular lines.

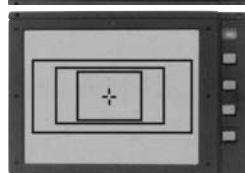

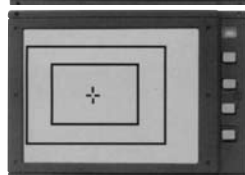

The marker is used to mark a specific point in the frame in order to duplicate the same exact framing on the next take.

The framelines are very accurate and stable.

Advanced functions include automatic centring of one frameline on another, and automatic centring of the framelines on the screen.

The outside of the largest frameline may be shaded.

Keypad clicks when a key is pressed.

Keypad glows in low-light.

Auto-memory: after a few seconds without changes the Frameline Generator automatically saves the configuration into memory.

Settings can be saved in 4 programmable memories and recalled at will.

All 4 memories are stored in a chip and do not depend on power or back-up battery.

Connections

BNC-Video In and Out

Lemo2 - DC power 10-28v

Hirose 6 - Power / Video Out
